

Exercise

- Titanic Dataset: <https://www.kaggle.com/c/titanic/data>
-

1. Load Titanic dataset. Plot how the **number of passengers varies by age** using a line plot.
 - Use `plt.plot()` with `color='g'` and markers.
 - Add **xlabel, ylabel, and title**.
2. Create **two separate figures** (`plt.figure()`)
 - First figure: `Fare vs PassengerId`.
 - Second figure: `Age vs PassengerId`.
3. Use `fig.add_subplot(2,2,1)` style to create a 2x2 grid:
 - Top-left: Histogram of **Age**.
 - Top-right: Histogram of **Fare**.
 - Bottom-left: Line plot of **Age vs Fare** (random 100 samples).
 - Bottom-right: Empty for practice (let them choose any visualization).
4. Plot a **histogram of Age** with:
 - 20 bins, `color='k'` (black), `alpha=0.5`.
 - Another histogram of **Fare** on the same figure, but different color.
5. Create a **scatter plot** of `Age vs Fare`.
 - Add `color='r', marker='o'`.
 - Observe if any **outliers** are visible.
